

FLEET SAFETY & DRIVER BEHAVIOUR ANALYTICS DASHBOARD

Project Objective

The objective of this project was to develop a centralized fleet safety monitoring dashboard to track driver behaviour, identify high-risk vehicles, monitor incident trends, and support data-driven safety interventions across the fleet.

The dashboard enables management to:

- Monitor fleet incident performance monthly
- Identify top risk trucks/drivers
- Track behavioural safety violations
- Support operational safety decisions
- Improve incident reduction efforts

Dashboard Snapshot

Key KPIs

KPI	Value
Fleet Size	20 Trucks
Total Incidents	1,927
MoM Change	-13%
Avg Incidents per Truck	96
Top Risk Truck	JBD682XB

Key Insights

- Fleet incidents reduced by 13% month-on-month, indicating positive impact of recent interventions.
- Risk remains concentrated among a few trucks, particularly JBD682XB and JBD671XB.
- Seat Belt, Camera Block, Forward Collision, VRU, and Lane Departure remain the most recurring incidents.
- Behaviour-related incidents continue to be the primary contributor to fleet safety exposure.

Recommendations

- Prioritize coaching and monitoring for top high-risk trucks/drivers.
- Reinforce seat belt compliance and proper camera usage.
- Conduct daily safety reviews focused on recurring behaviours.
- Maintain monthly dashboard reporting to monitor intervention effectiveness.

Business Impact

This dashboard improved visibility into fleet operational risk and supported targeted safety intervention planning through data-driven reporting and behavioural trend analysis.
